

Abstract

What is proposed is a locking device (5) for locking a filler neck compartment cover of a vehicle that can be moved into an open position and into a closed position, said cover comprising a locking element (20) for blocking the filler neck compartment cover in the closed position and a servo drive (19) for displacing the locking element (20) from a release position into a blocking position. The locking device (5) is distinguished in that it is designed as a preassembled, modular unit and can be fastened in the edge region of a mounting opening (3) provided in a body part (1) and serving to house a filler neck compartment (7).

Also proposed are a method of mounting the locking device (5) and an arrangement of the locking device (5) and the filler neck compartment (7) on the vehicle.
